FOR IMMEDIATE RELEASE

For further information contact Jesse Carter, public information officer, at 740-203-2085.

DELAWARE, Oh., June 1, 2011 – The time has arrived once again for residents to protect themselves against mosquito bites and take steps against mosquito breeding.

The Delaware General Health District will soon resume its summertime mosquito trapping program to monitor for diseases which mosquitoes spread.

Mosquitoes can spread La Crosse Encephalitis, West Nile virus, and other diseases. Human cases of West Nile virus in Ohio have declined in recent years, but the disease caused more than 140 illnesses and 10 deaths in our state over the last six years. An average year sees about 20 Ohioans get La Crosse Encephalitis, which often requires hospitalization. Both of those diseases can cause neurological difficulties that last for years.

West Nile virus was not detected in mosquitoes in Delaware County last year for the second year in a row, although it was found in numerous mosquitoes in Franklin and Licking counties. That followed several years in which West Nile virus showed up in mosquitoes and/or birds collected by the Delaware General Health District. A human case of La Crosse Encephalitis last occurred here in 2005.

Mosquito prevention – achieved by emptying water from breeding pools -- is the best precaution against these diseases. Empty standing water out of flower pots, bird baths, and other outdoor containers regularly, and keep gutters and other potential mosquito breeding places free of stagnant water. Large areas of standing water can be treated with larvicide, sold commercially as “Mosquito Dunks.” The Health District’s Residential Services staff has treated some mosquito problem areas with larvicide already this season.

Residents also should protect themselves against mosquito bites, particularly early in the evening when mosquitoes are most active. If you must go outdoors, protect yourself by wearing light-colored long pants and a long-sleeved shirt and by wearing mosquito repellent containing DEET or Picaridin. Apply repellent according to the manufacturer's instructions.

Starting later this month, the local Health District will set up to 10 mosquito traps nightly at varying locations throughout Delaware County. Mosquitoes that are caught will be shipped to the Ohio Department of Health laboratory for West Nile Virus testing.

The Health District also will log reports of dead crows and blue jays, birds which are susceptible to dying from West Nile virus. Anyone finding a freshly deceased crow or blue jay is asked to report it to the Health District by phoning 740-368-1700. Dead birds are not being collected again this year because the state laboratory is not testing them.

The Health District will fog to kill adult mosquitoes if mosquito-borne diseases are detected through mosquito trapping or a report of a human disease case. Fogging plans will be announced to local news media, posted on www.delawarehealth.org, and recorded on the Health District Information Line, 740-203-2015.

Fogging takes place between sunset and midnight along public roads and streets. Anyone who does not want mosquito fogging adjacent to their property can phone the Health District at 740-368-1700 and ask to be placed on the "no-fog list."
