Date Received: Property Address

1 West Winter Street, 2<sup>nd</sup> Floor, P.O. Box 570, Delaware, Ohio 43015 Phone: (740) 368-1700 Fax: (740) 368-1736

Drip Desi	gn Plan Checklist	
erty Owner:		

Indicates plan meets ODH & DGHD requirements	YES	NO	N/A
Site and Soil Survey			
Do the plans match the calculations			
Notes Required			
Designation in notes that the designer is available to make adjustments and address concerns, as			
needed			
O&M requirements noted or provided			
Designation of any other obstructions			
Designation in notes that homeowner has been informed of system options and cost			
Designation in notes to contact designer before making changes to the design			
Designation in notes for protection of primary and replacement areas			
Date designer and/or designee visited the site			
Installation instructions			
29-05			
Site review fee paid			
Plan review fee paid			
29-06			
No unapproved connections to STS (e.g. roof, foundation, clear water sump, swimming pool, etc.)			
System is non-discharging			
10' isolation distances (utility line, roadway, driveway, property line, right-of-way, sealed well, recorded easement,			
intermittent stream, swale, geothermal horizontal closed loop, irrigation line, GWRS, hardscape, etc.)			
50' isolation distances (surface water impoundment, lake, river, wetland, perennial stream, road cut-bank, stream cut-bank, water supply source, vertical open and closed loop geothermal, etc.)			
STS sited on lot	_		
STS not in floodway, or wetland	_		
If within 100 year flood plain, STS is below grade	_		
	_		
Sanitary sewer not accessible 29-07			
		1	
Soils submitted by qualified individual			
Limiting conditions described and noted	_		
Depth to limiting layer adequate  Depth to restrictive layer adequate	_		
Soil horizons and depth indicated Soil texture and structure of each horizon indicated	-		
Slope and contours indicated	_		
	_		
Basal loading rate and linear loading rate are appropriate for soils utilized	_		
Soil classifications		1	
Highly permeable soil identified			
29-10 House plan provided (with hodgeses)			
House plan provided (with bedrooms)	_	_	-
Daily design flow (with anticipated variations)	_	-	
Plan view		1	
Rationale for design, if differing from standards	_	-	
LIGCCFINTION OF TRACEMENT NYCCOCC		•	

Topography, scale, and north arrow provided		
Elevations (house, tanks, pumps, beginning/middle/end of distribution area etc.)		
Dimensions of property		
Pump info/pump curve		
Pressure distribution network with description and calculations		
Product info (Materials, Components, Tank Sizes, etc.)		
Length and width of treatment areas adequate		
Designation of primary and secondary treatment area mapped on plan		
Adequate access for O&M equipment provided		
Designation of hardscapes, easements, disturbed areas, soil boring locations, wooded areas, and		
notable areas of concern mapped on plan		
29-12		<u></u>
Tank size adequate		
Tank approved by ODH		
Dosing tank accommodates reserve and/or surge capacity		
Pump properly sized and provided with accessible quick disconnect		
Air vacuum release valve (needed if pump fitting or transport line is at a higher elevation than soil absorption component.)		
Switches, controls, alarms and electrical devices are in an easily accessible location		
Control panels and alarms on exterior and 1 foot above grade		
Building sewer-no angles >45 degrees, 1-10% elevation change in pipe, and cleanout provided	+ +	+
Additional cleanouts indicated when needed (over 75' and every 100' thereafter)		
29-13		
Pretreatment components have effluent sampling capability after pretreatment		
If depth ≤ 2', 8" spacing between inlet and outlet pipe		
If depth >2' but ≤6', 12" spacing between inlet and outlet pipe		
At least 2" elevation difference from inlet to outlet		
At least 2" elevation difference from inlet to outlet 29-14		
29-14		
<b>29-14</b> Pretreatment device utilized for depth credit meets standards for selected depth credit		
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15		
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15 Limiting condition not specified-VSD-18" In situ-8"		
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15 Limiting condition not specified-VSD-18" In situ-8" Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ- 12"		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ- 12"  Perched seasonal water-VSD 18" In situ 6"		
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15 Limiting condition not specified-VSD-18" In situ-8" Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ- 12" Perched seasonal water-VSD 18" In situ 6" Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance		
29-14 Pretreatment device utilized for depth credit meets standards for selected depth credit 29-15 Limiting condition not specified-VSD-18" In situ-8" Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12" Perched seasonal water-VSD 18" In situ 6" Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ- 12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart  Method for uniform stream dispersal from orifice noted (shielding/spash plate etc.)		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart  Method for uniform stream dispersal from orifice noted (shielding/spash plate etc.)  Inspection port in each pressure leaching trench with 4" opening		
Pretreatment device utilized for depth credit meets standards for selected depth credit  29-15  Limiting condition not specified-VSD-18" In situ-8"  Fractured or karst bedrock, ground water or aquifer, flow restrictive layer-VSD-36" In situ-12"  Perched seasonal water-VSD 18" In situ 6"  Sand elevation 1:1 soil depth credit utilized (12" credit) but maintains min. infiltrative distance  Pathogen reduction depth credit utilized (12" credit) but maintains min. infiltrative distance  Timed micro-dosing depth credit utilized (12" credit) but maintains min. infiltrative distance  LPP distribution soil depth credit utilized (6" credit) but maintains min. infiltrative distance  Most limiting in situ soil layer within 6" of infiltrative surface or basal surface utilized for sizing  If a reduction for an existing lot is utilized, an explanation of need is provided  Oriented parallel to natural contour  Zones are designed to prevent stacking  29-15.1  Dose less than 1/4 daily design flow and 5 times void volume of laterals  When flow restrictive layer within 12" of surface, Dose 1/8 design flow & 3 times void  If zoned, dosing equal  If time dosed, dosing spaced uniformly throughout the day  Direction of orifices and method for shielding designated  Orifice number and spacing provide distribution of no more than 6 sq. ft. per orifice  Orifice size ≥1/8", ≥6" from end of lateral and ≤ 6' apart  Method for uniform stream dispersal from orifice noted (shielding/spash plate etc.)		

Shutoff mechanism provided		
29-16 If utilized during design		
STS 8' from drain tiles		
Interceptor drain, if used 6' upslope		
Perimeter drain, if used 6' upslope 8' elsewhere		
Perimeter drain at least 8' from mound lateral or 1 ' from toe		
Subsurface drainage 4" in diameter		
Subsurface drainage at least 10" of coarse aggregate		
Subsurface drainage positive slope of 1/10' per 100'		
Engineered drainage shows depth to seasonal water with and without drainage		
Drainage outlet-accessible, rigid wall, animal guard		
Drainage outlet-sufficient freeboard-at least 4" above water level		
Drainage outlet-permission received for discharge point, when applicable		
DRIP		
Surface water diversion addressed, as needed		
If slope greater than 25%, special safety considerations included		
Calculations included		
Calculations included		
Calculations included VSD matches soil report		
Calculations included  VSD matches soil report  If plowed into soil, not more than 1' depth		
Calculations included VSD matches soil report If plowed into soil, not more than 1' depth If at grade or plowed in, 2' spacing between lines		
Calculations included VSD matches soil report  If plowed into soil, not more than 1' depth  If at grade or plowed in, 2' spacing between lines  If on sand fill, spacing between 6" and 2'		
Calculations included  VSD matches soil report  If plowed into soil, not more than 1' depth  If at grade or plowed in, 2' spacing between lines  If on sand fill, spacing between 6" and 2'  Cover material and freeze protection precautions included		
Calculations included  VSD matches soil report  If plowed into soil, not more than 1' depth  If at grade or plowed in, 2' spacing between lines  If on sand fill, spacing between 6" and 2'  Cover material and freeze protection precautions included  Scouring flush at least twice per month per zone
